Paper Title

Real-Time Virtual Mentor for Introductory Programming Feedback

Reviewer #1

Questions**1. Paper matching and topic relevance of the research to the scope of conference**

Yes

2. Paper is matching to requirements of the conference

Recommended to improve

3. Completeness of abstract to the paper

Recommended to improve

4. The presence of good analysis of the subject area

Recommended to improve

5. Paper relevance

Relevant

6. Paper novelty

Moderate

7. The presence of scientific components:

New methodology

New technology

New Model/ Modeling

Filled a gap of knowledge

New applied Case Study

8. Used materials level

Moderate

9. Conclusion and its validity

Moderate

10. Detailed comments to paper author, about paper novelty, final decision (up to 2000 symbols)

The paper addresses an important challenge in CS1 education with a real-time virtual mentor. While the work is relevant, the novelty could be further highlighted by clearly distinguishing it from existing LLM-based assistants and intelligent tutoring systems. Consider expanding the discussion on how your approach improves over prior

solutions, adding larger-scale or longitudinal evaluation results, and clarifying limitations to strengthen its contribution.

Questions

1. Paper matching and topic relevance of the research to the scope of conference

Yes

2. Paper is matching to requirements of the conference

Recommended to improve

3. Completeness of abstract to the paper

Complete

4. The presence of good analysis of the subject area

Recommended to improve

5. Paper relevance

Low

6. Paper novelty

Moderate

7. The presence of scientific components:

New Model/ Modeling

New applied Case Study

8. Used materials level

Moderate

9. Conclusion and its validity

Moderate

10. Detailed comments to paper author, about paper novelty, final decision (up to 2000 symbols)

The paper presents a system for real-time personalized feedback in introductory programming. Its architecture and pedagogical policy are clearly described and demonstrates a modular pipeline with analyzer, student model, and feedback engine, which is appropriate for pedagogical-oriented research.

In general, the paper has limited experimental scale (dataset size clarity) and lacks strong technical depth in algorithms. Used components are known (ITS + LLM + feedback systems), scientific novelty is mainly in integration + real-time constraint.

Used dataset description is weak - no information about number of students, distributed tasks. No benchmark comparison. No statistical or learning outcome validation (only short-term metrics)

The work is partially pedagogical, which may limit its suitability for SIST unless technical

contributions are emphasized more. Contribution is mainly integration and latency optimization.
